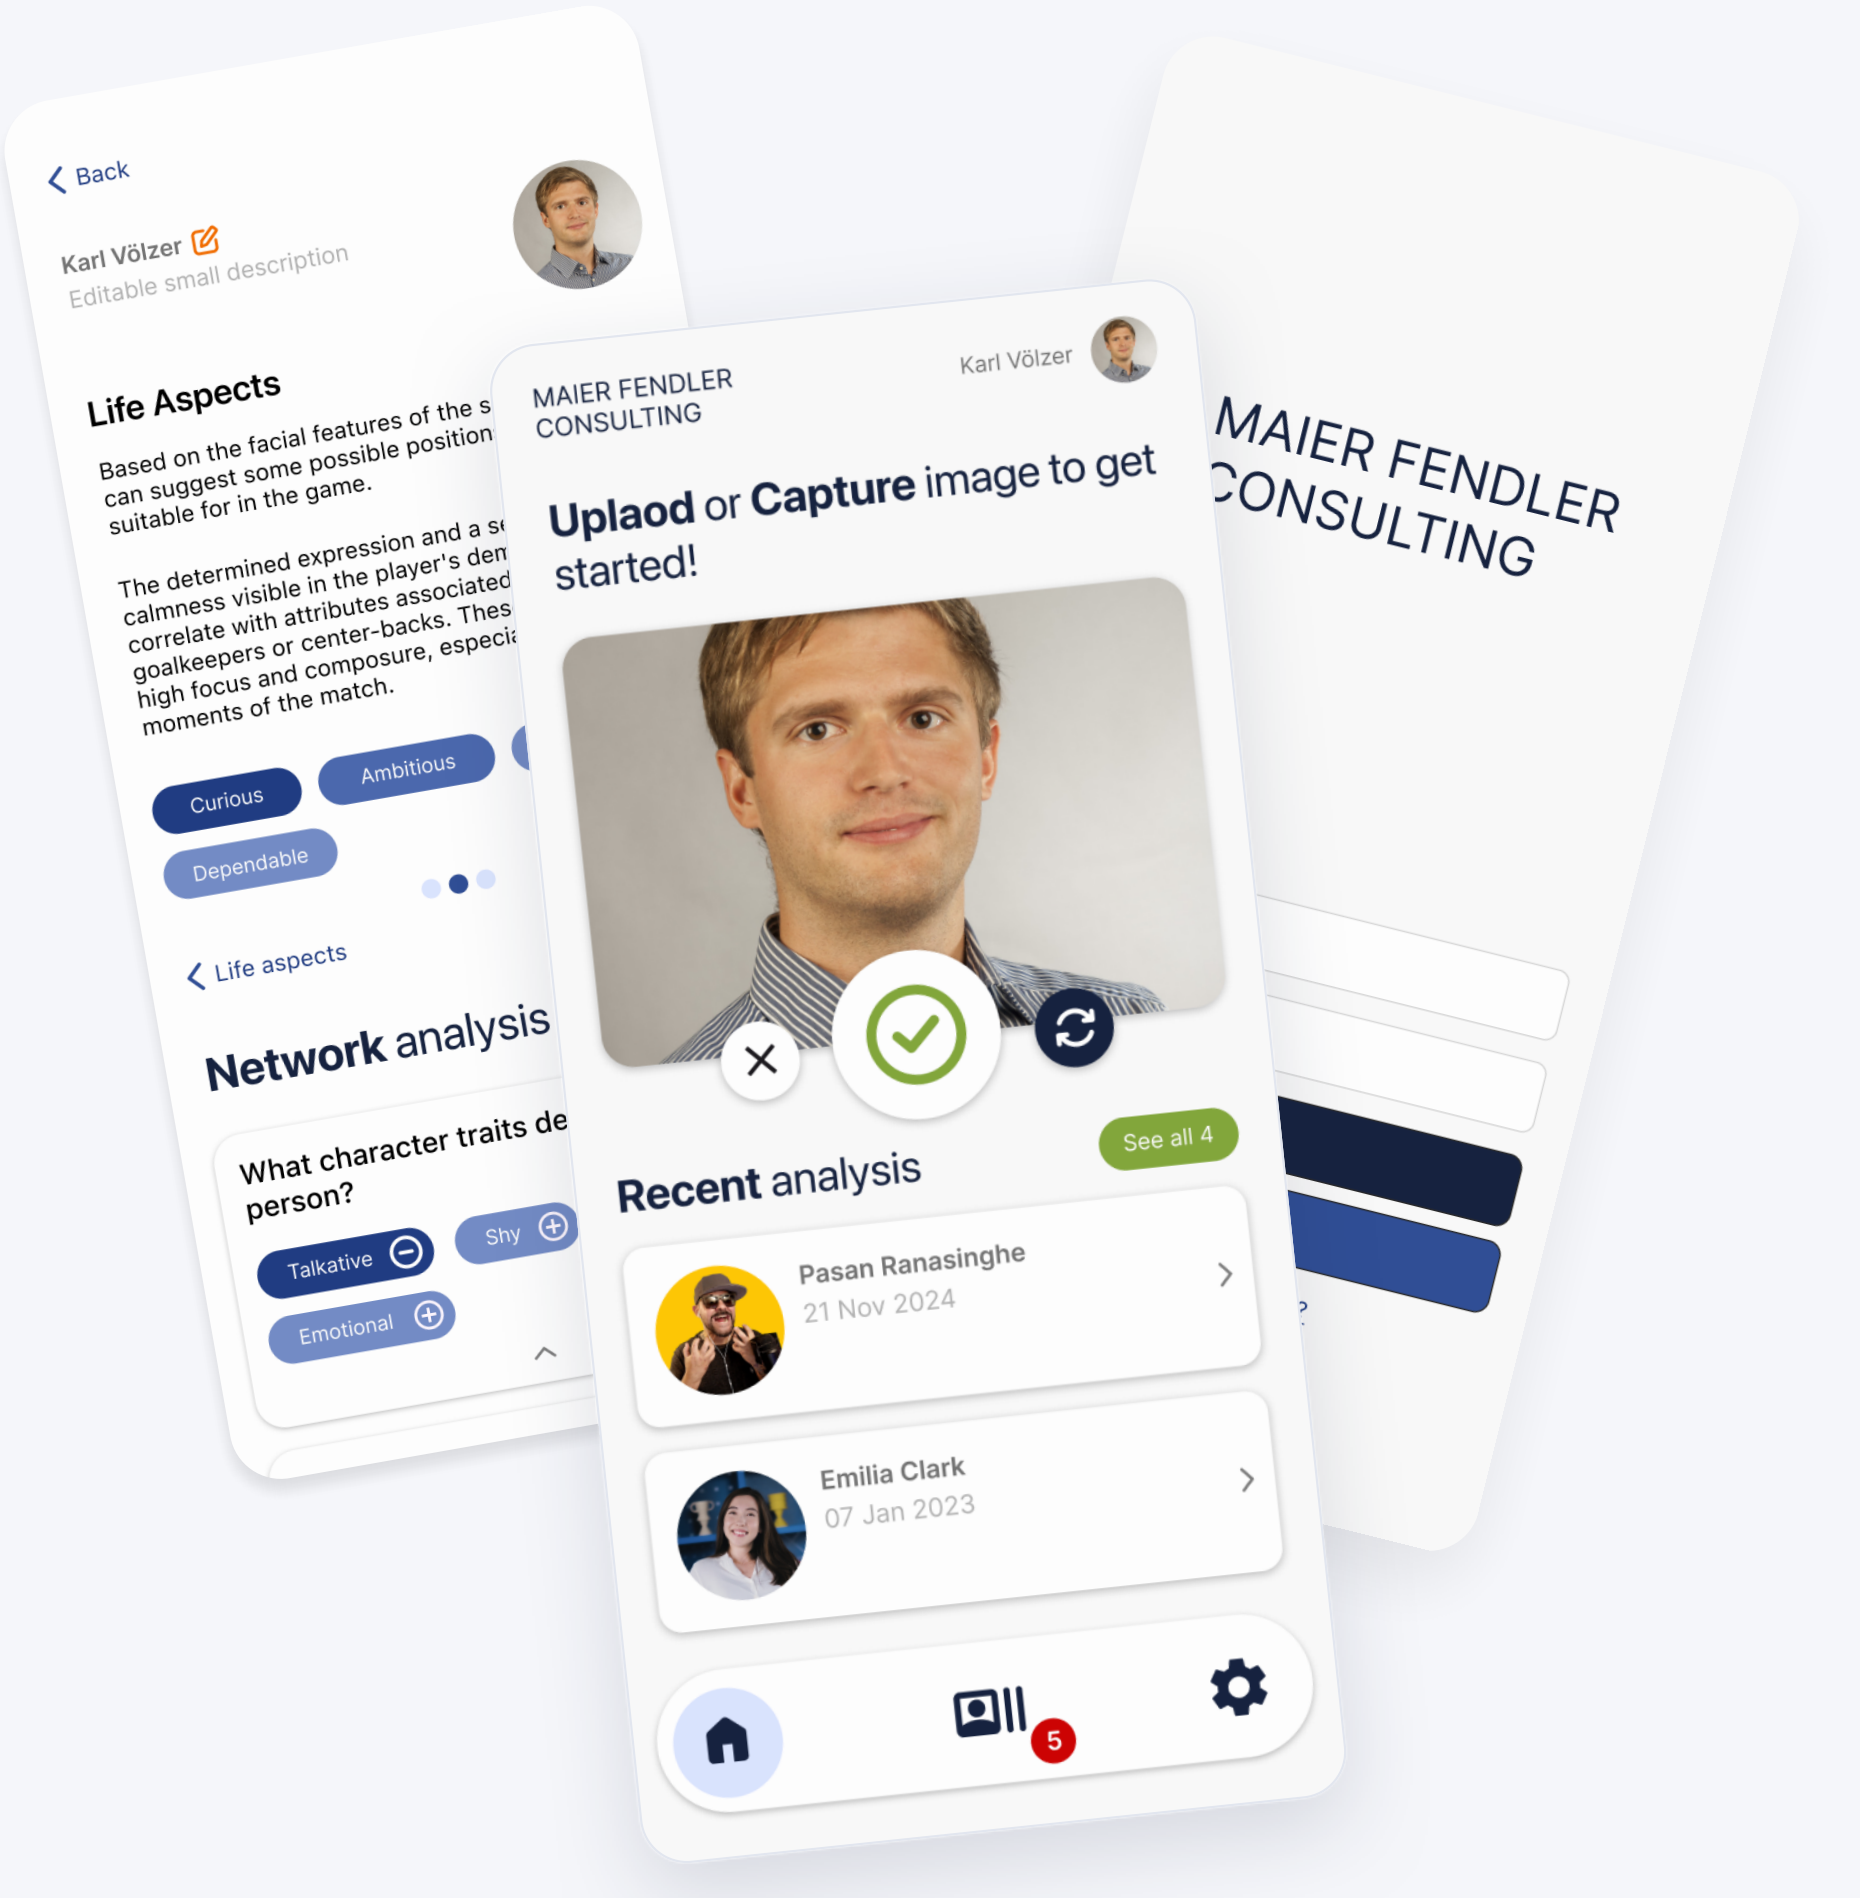
MAIER FENDLER

MAIFE
Personality and face reading

Designing of an AI face reading app that turns a single portrait into clear, actionable personality insights.



What is MAIFE?

Maier Fendler Consulting applies face reading as a coaching and consulting approach to grasp how individuals think, decide, and communicate. Previously, this expertise resided in workshops and one-to-one sessions.

MAIFE translates its approach into a mobile app: users upload or capture a portrait, an AI model evaluates facial features, and the app describes the persona behind the face, along with ways to motivate, address, and collaborate with that particular ndividual.

The task is to make an unfamiliar, sensitive idea feel straightforward, reliable, and practical within seconds.

General assessment
Overall character analysis of the person

Determination
Drive, ambition and goal orientation

Control
Composure and self-regulation under pressure

Discipline
Focus, structure and reliability

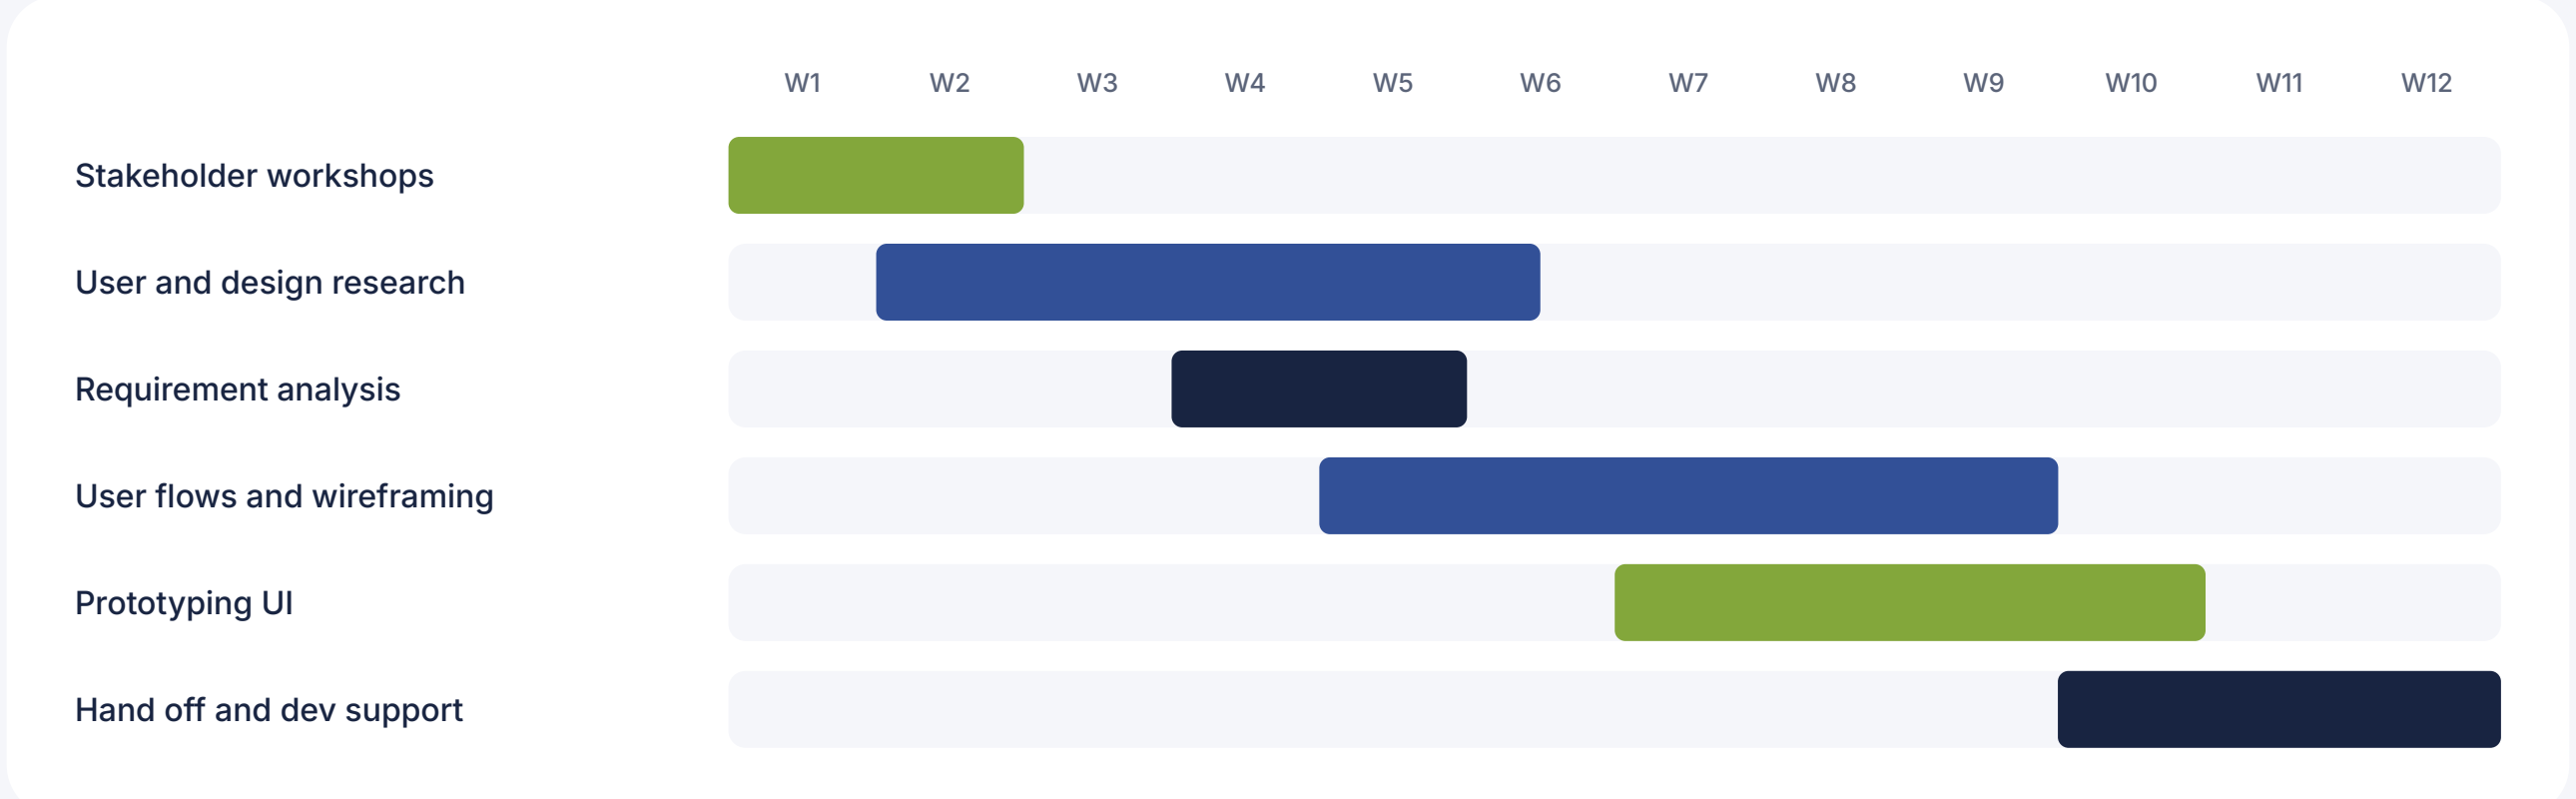
End-to-end product design

Served as the sole designer within a group consisting of one frontend developer, two full stack developers, and subject matter experts who were face reading consultants. I managed research, requirements, information architecture, UI design, and the hand-off to development.

- Research
- User personas
- User stories
- User flows
- UI/UX design
- Handover

Project timeline

A lean, iterative double-diamond: understand the method and the people first, define the requirements, then design and validate in short loops with the consultants and developers.



Use case for face reading tools.

Face reading is a specialized approach guided by experts. I developed it into a product by blending insights from Maier Fendler consultants with discussions with potential users who meet, lead, or evaluate people in their work.

01
Stakeholder & SME interviews
Workshops with the face-reading consultants to understand the method, its vocabulary and which outputs matter most.

02
Target-user interviews
Semi-structured talks with coaches, HR and team leads about how they prepare to meet, hire or lead people.

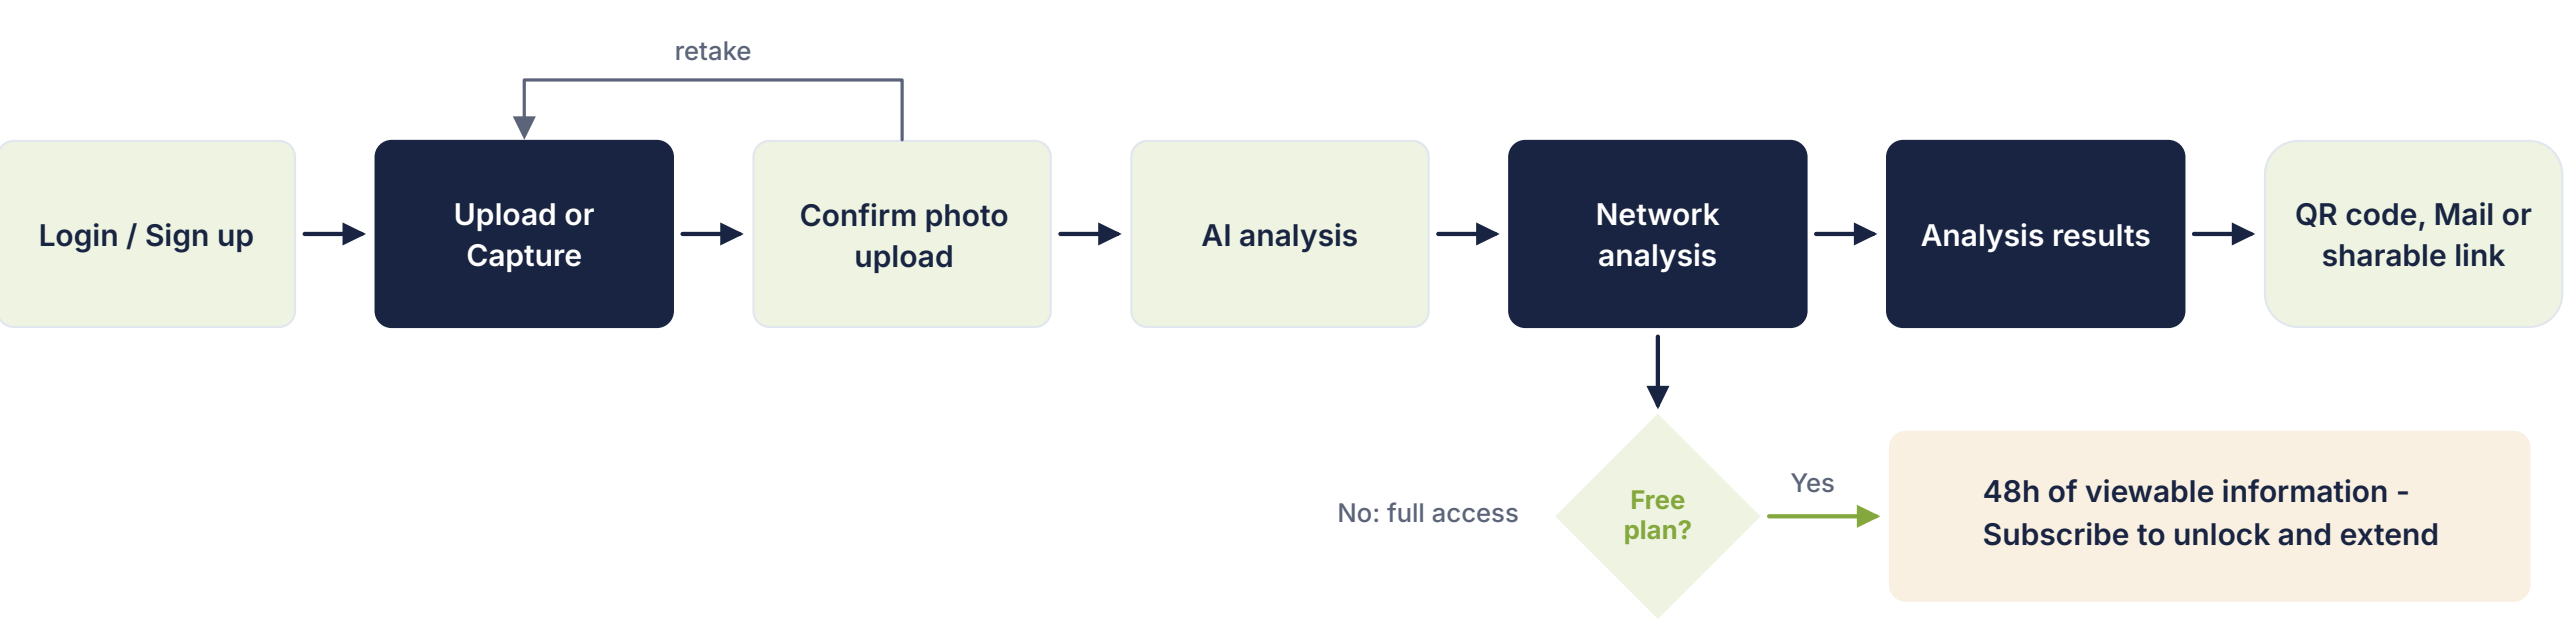
03
Process analysis
Mapped the analog consulting session - from photo to written profile making it fully digital in the process end to end.

04
Competitive review
Reviewed personality tests, psychometric and AI face analysis apps for patterns, gaps and trust signals of individual persons.

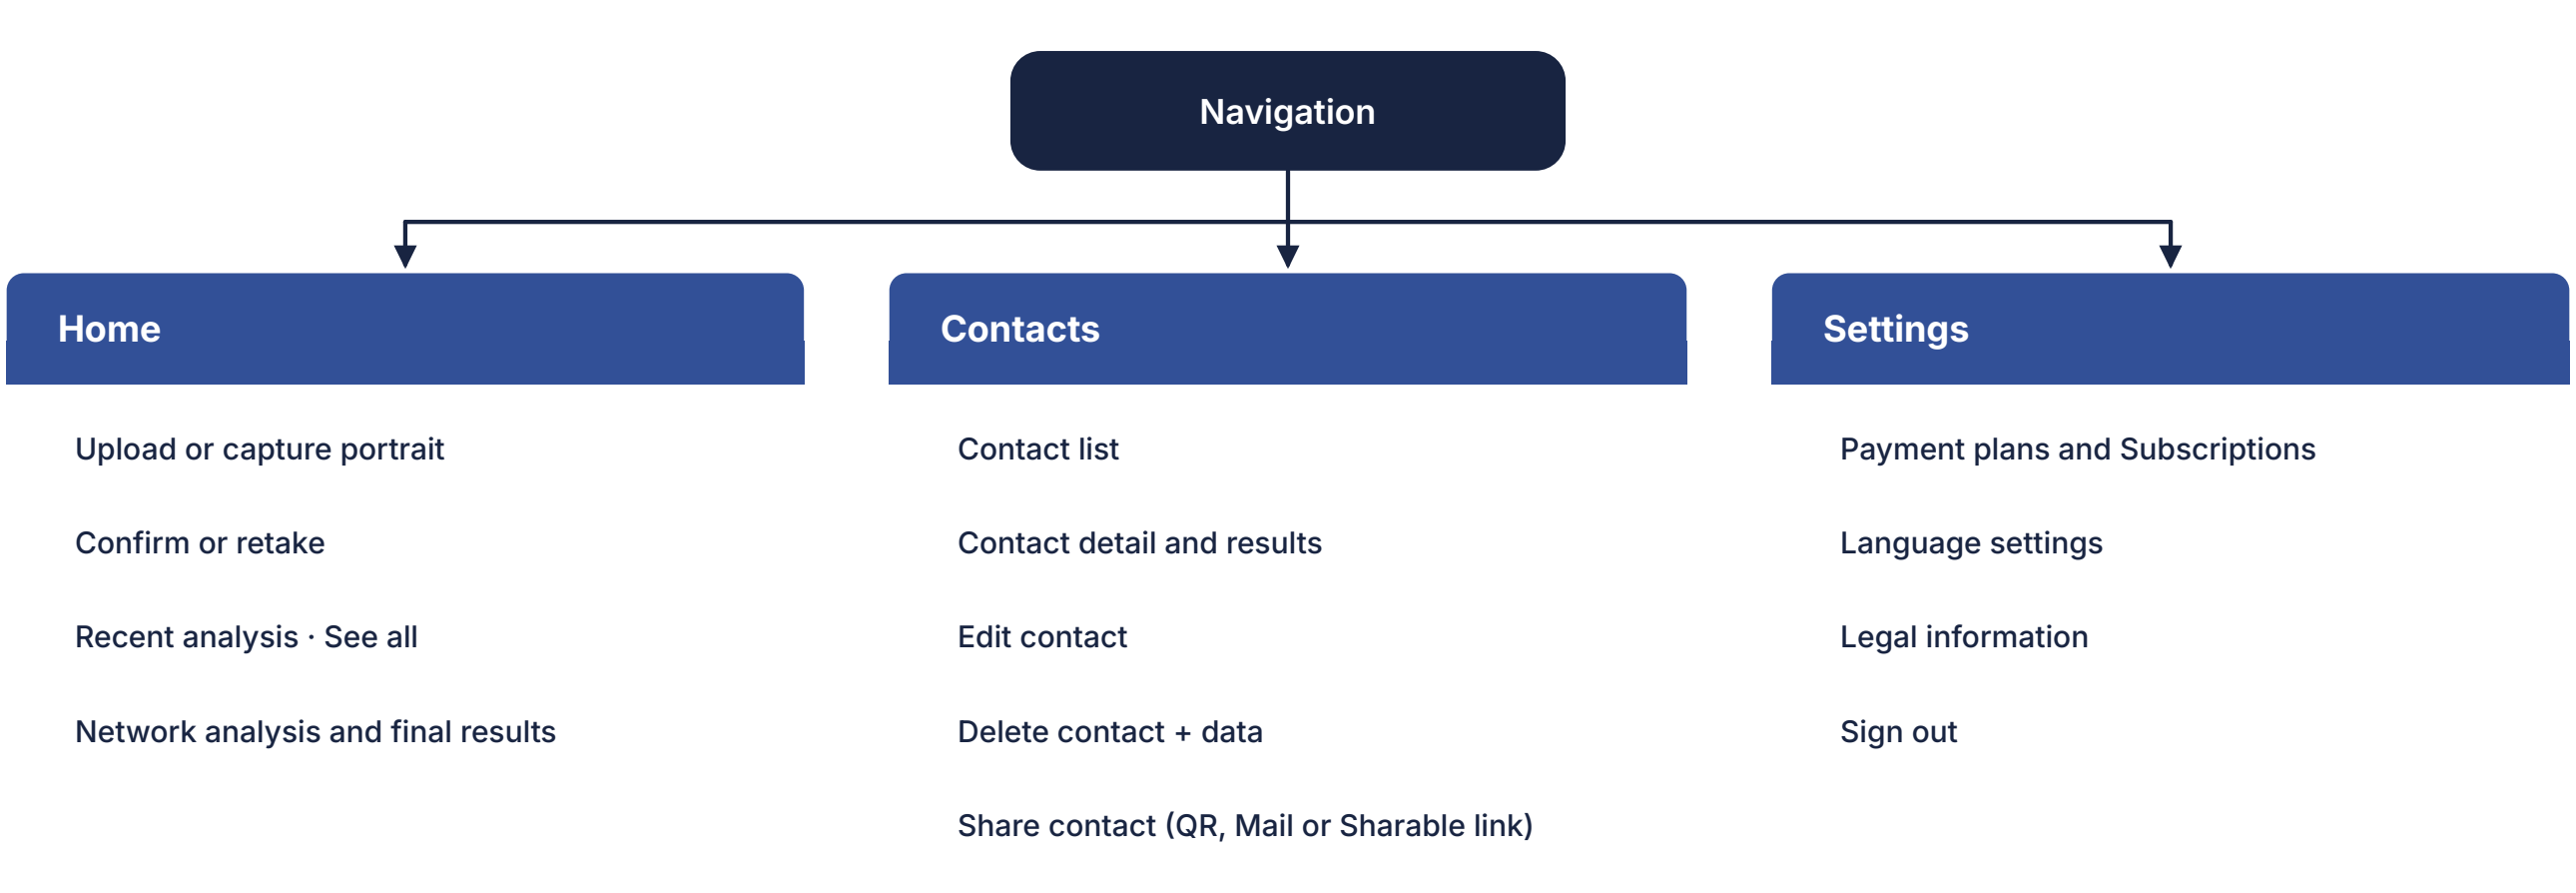
User flow & information architecture

The central process moves a user from a portrait to shareable insights across five steps. All other features sit behind the straightforward tab based navigation.

Core user flow



Information architecture



Home	Contacts	Settings
Upload or capture portrait	Contact list	Payment plans and Subscriptions
Confirm or retake	Contact detail and results	Language settings
Recent analysis · See all	Edit contact	Legal information
Network analysis and final results	Delete contact + data	Sign out
	Share contact (QR, Mail or Sharable link)	

From insights to requirements

Working alongside consultants and developers, stakeholders, Subject matter experts, I was able to converted the research into functional and non functional requirements. Additionaly used **MoSCoW** to prioritize the requirements for a targeted initial release.

Functional requirements

ID	FUNCTIONAL REQUIREMENT	PRIORITY	SCREENS
FR-01	Login / Sign up and reset password	Must	Login
FR-02	Upload or capture a portrait (Recursive functionaility)	Must	Home
FR-03	AI analysis with network analysis and trait spectrums	Must	Network analysis
FR-04	Detailed results on Characteristics, Life aspects, Communication	Must	Analysis results
FR-05	Contact list, description (Editable), delete incl. all information	Must	Contacts · Edit contact
FR-06	Share results via QR code, Email or via sharable link	Should	Share contact
FR-07	48h result visibility and upgrade plans	Should	Network analysis · Settings
FR-08	Settings with payment, language, legal information and sign out	Should	Settings
FR-09	Recent analysis and 'See all' on home screen	Could	Home

Non-functional requirements

Privacy & GDPR
Consent, limited result visibility and full deletion of a contact's data.

Performance feedback
Clear states while the AI model analyses a portrait.

Cross-platform
One React Native codebase for iOS and Android.

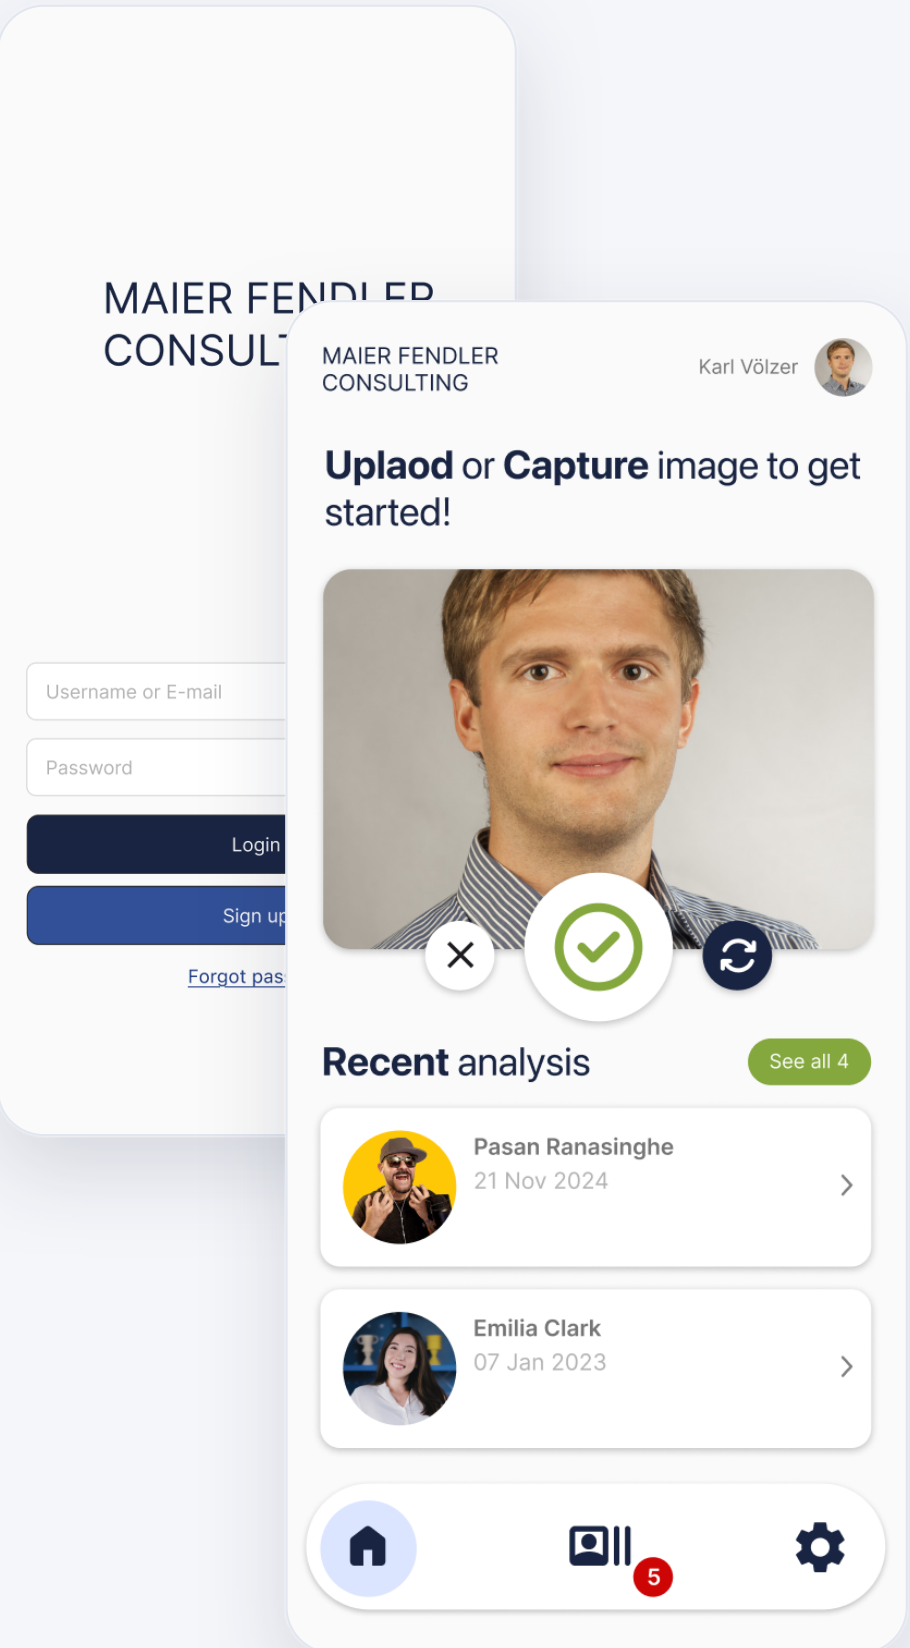
Consistency
Material UI components and shared design tokens.

Localisation
Language switch for English and German users.

Accessibility
AA contrast, 44 pt touch targets, readable type sizes.

Design decisions and UX

Each screen was designed around one core functionaility . Below are few of the key decisions and the reasoning behind each screen.



Login and Home screen
Brand identity and concept of 'Snap and Go'

Brand before form
The wordmark sits in the upper half; inputs and buttons are placed in the thumb zone.

Clear hierarchy
Navy "Login" as primary, blue "Sign up" as secondary and "Forgot password?" as a text link.

One Primary action
"Upload or Capture" is the primary focussed task on the home screen. Three clear controls (discard, confirm, switch camera) takes the user from photo tupload o analysis in one tap.

Pick up where you left off
"Recent analysis" cards and a three-tab bottom navigation let returning users find past results quickly

Analysis and results
Turning results into clear, trustworthy guidance

Guidance instead of grade
Results are framed as everyday questions like "How should this person be addressed?" Spectrums show tendencies instead of exact scores.

Scannable depth
Collapsible question cards with counters keep a long analysis readable. Users interact only with what they find as needful information.

Narrative plus traits
A short explanation shows the reasoning behind each result. Trait chips (Curious, Analytical, Open minded) summarise the profile at a glance.

Transparent access
AClear guidance ind info about limitations and direct links to upgrade options, so there are no surprises about the users data.

What character traits define this person?
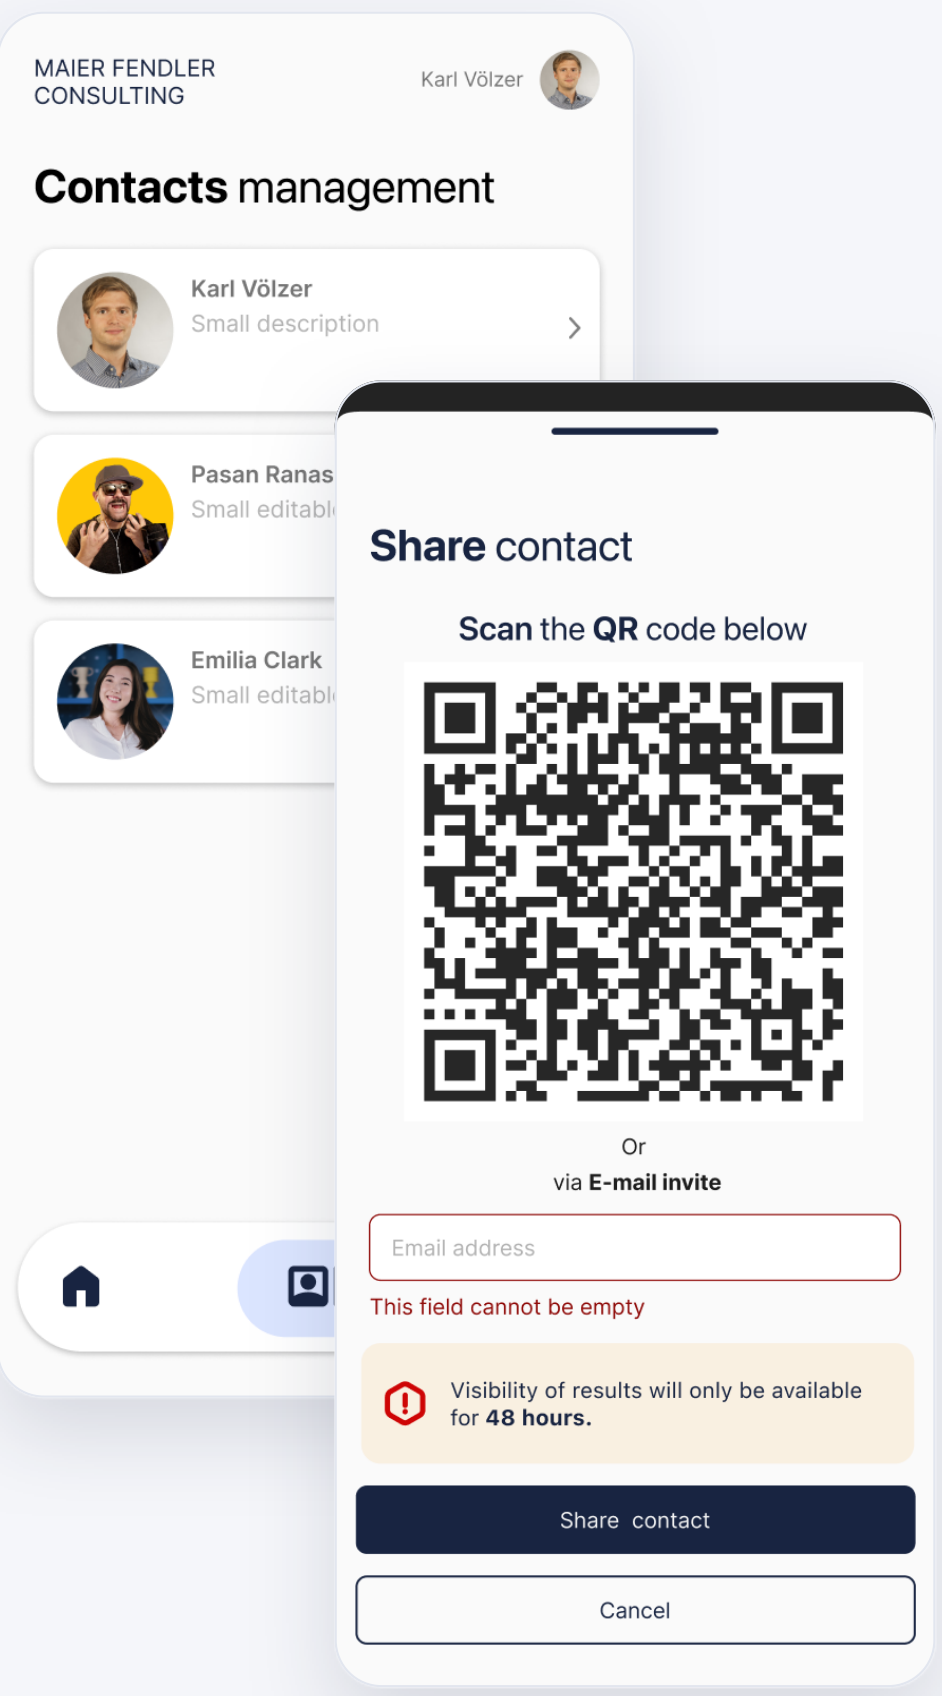
1/2
How should this person be addressed?
3/6

Based on the facial features of the soccer player, we can suggest some possible positions they might be suitable for in the game.

The determined expression and a sense of calmness visible in the player's demeanor may correlate with attributes associated with goalkeepers or center-backs. These roles demand high focus and composure, especially during critical moments of the match.



Contacts
Manage contact and share

Sharability
Easy access to share contact information of individuals via QR code or unique link.

Managing contacts
Ability to edit, update, delete and duplicate contact information for each face scan performed.

Managing contacts
Ability to edit, update, delete and duplicate contact information for each face scan performed.

A custom MUI design styling

The MUI based UI kit follows standard MUI conventions so every element maps to a React Native components with a cherry picked color and gradient palette derived from the Maier Fendler brand.

Colour

Navy - #182441
Primary

Cream - #F9F0E1
Information banner(s)

Blue - #325097
Secondary

Surface - #FAFAFA
Background

Olive - #84A83D

Team, tools & learnings

- **1** Product designer (me)
- **3** Developers : 1 Frontend, 2 Full-stack
- **8** Core screens in the first release
- **2** Platforms : iOS & Android

Technology & tool stack

Learnings

Language makes a niche method approachable
Framing results as everyday questions did more for comprehension than any visual treatment.

Privacy is a feature
Being explicit about visibility and deletion turned a sensitive topic into a trust signal.

Design in the developer's language
Building on MUI kept design and React Native implementation closely aligned.
